

Description of Files: This is the code and data files used to generate the tables displayed in “A Dynamic Forecast: An Evolving Prediction of the 2024 Presidential Election” and to generate the forecast associated with that paper available at:

<https://docs.google.com/spreadsheets/d/1IY2K4ZINICHXUbFjrcVFcNv4PL-e1OHik1SoxO3yu0M/edit?gid=705324711#gid=705324711>

Executing the code in [PS File.R](#) on the following files will show how the models displayed in table 1 were produced:

[Election Model Calibration - April 15.csv](#)

[Election Model Calibration - June 1.csv](#)

[Election Model Calibration - July 15.csv](#)

[Election Model Calibration - Sept 1.csv](#)

[Election Model Calibration - Oct 1.csv](#)

[Election Model Calibration - Election Day.csv](#)

Each file is used to calibrate the predictive model to a different date in a given election cycle

Running the code in [PS File.R](#) on the following files will show how the model for the out-of-sample test displayed in Table 2 was produced:

[Election Model Calibration - Election Day No 2016.csv](#)

[Election Model Calibration - Election Day No 2020.csv](#)

The analysis for table 2 was executed in [Out of Sample Tests.xlsx](#) File. The analysis is executed in the “2020 Out of Sample” and “2016 Out of Sample” sheets. Cells I23, M23 and P23 on each sheet show the model errors for the full model, the out of sample model and polls respectively. The models’ and polls’ errors are estimated taking the square root of the average of squared errors for all model estimates/polls in a given cycle.

Tables 3 and 1A and Figure 1 were produced from the September 1 forecast, which is available in full in [PS Copy of Public 2024 Presidential Election Model - September 1, 4 02 PM \(1\).xlsx](#)

Figures 2 and 3 were produced using data from the April 15, June 1, July 15 and September 1 forecasts, all of which are available in [PS Key Dates Forecast.xlsx](#). For ease of interpretation, the tipping point state is bolded.

Running the code in [PS File.R](#) on the following files will show how the model in Table 2A was produced, used to calculate the short term effect of Biden dropping out on national polling:

[Out of Sample Tests - Switch.csv](#)

Program used to execute code: R

Packages needed: Stargazer
